WHY IS DEEP SCANNING IMPORTANT?

INCREASING USAGE

According to a February 2015 Gartner Research survey, **99%** of responding organizations reported using open source .

COMPLIANCE

With **thousands** of open source licenses in existence, each with their own terms of use, it's critical to ensure compliance with all legal requirements.

ENFORCEMENT

Companies that have formal policies to track open source usage are still vulnerable due to lack of enforcement.

DECLARATION TOOLS

Other open source tools are not sufficient to detect deeply embedded packages, especially if developers fail to declare them.

RISK MITIGATION

Without deep scanning, it's impossible to truly know if open source code exists in your code base. Mitigate the chance that your company is exposed to IP/legal risks due to not properly following terms of use.

Open Source License Compliance is Critical

License Analyzer: A New Approach to Open Source Scanning Using AI

How Does License Analyzer Work?

Improper usage of OSS can threaten your IP. In addition, searching for and declaring OSS licenses and copyright statements are an integral part of the due diligence process prior to a software release or acquisition of a software company. **License Analyzer** leverages a library of 400+ commonly used license text, scans source code and identifies known licenses. **License Analyzer** also scans code for copyright info, and author information. **License Analyzer** mimics human reviewers and drastically reduces the burden of manual source code review. Most large enterprises have large teams of people performing manual review, and **License Analyzer** aims to assist them creating efficiencies and reducing costs.

Accuracy

Leverages unique artificial intelligence engine that intelligently scans source code. Accurately identifies license information while minimizing the number of false positives.

Secure Data

We offer flexible solutions that can be integrated into your workflow. On premise solution ensures that your valuable source code is not uploaded to another network keeping it safe and secure. We also have the ability to connect to the private cloud. For smaller enterprises , a secure cloud-based SaaS solution will be available by end of year.

Speed

Underlying engine scans at lightning fast speeds reducing the source code review process. Fast automation of source code scanning will lead to efficiencies in the development and review process as well as lead to reduction in costs for your organization.

Big Data + AI

Big Data and Artificial Intelligence is ingrained in our company's DNA. Our mission is to build unique products that help large enterprises solve difficult problems in open source software management.
